<u>REMARKS</u>

Claims 1-20 are pending in this application. Claims 1, 4-6, 8, 11, 12, 14, 16, 17 and 19 are currently amended.

<u>Claims Rejections Under 35 U.S.C. § 101</u>

The Examiner rejected claims 1-20 under 35 U.S.C. § 101 as directed to non-statutory subject matter. Applicants respectfully traverse the Examiner's rejections. The claims are directed to the physical manipulation of physical data samples. A physical data input sequence is received and a physical output sequence of digital audio samples is produced. Nevertheless, Applicants have amended the claims to recite "producing" (or similar language). Accordingly, Applicants respectfully submit that claims 1-20 are directed to statutory subject matter.

<u>Claims Rejections Under 35 U.S.C. § 103</u>

The Examiner rejected claims 1-16, 11, 18 and 19 under 35 U.S.C. § 103(a) as being unpatentable over Uramoto (European Patent Application No. 0 506 111 A2). Applicants respectfully traverse the Examiner's rejections.

The Examiner argues that Uramoto teaches decoding of digital video data, and that it would have been obvious to apply the teachings of Uramoto to digital audio data. This argument assumes that Uramoto teaches, suggests or motivates each of the recited elements for the decoding of digital video data. This assumption, however, is incorrect, as explained below.

Turning to the language of the claims, claim 1, recites, in part "[a] method of **decoding** digital audio data, comprising the steps of … preprocessing the input sequence of data elements to produce an array of sum data and an array of difference data **using selected data elements from the input sequence** …" (emphasis added). Similarly, claim 11 recites, in part, "[a] synthesis sub-band filter for use in **decoding** digital audio data, comprising … pre-processing means for producing an array of sum data and an array of difference data **using selected data elements from the input sequence** …" (emphasis added).

The portions of Uramoto to which the Examiner points do not teach or suggest a method of decoding digital audio data, as recited. To the extent decoding is addressed, a different method is taught. The portion of Uramoto to which the Examiner points, including the discussion of digital video encoding on page 2, teaches using the discrete cosine transform (DCT) for **encoding**. See Figure 5 of Uramoto and the accompanying description thereof on page 8, lines 15-37. Uramoto teaches using the inverse discrete cosine transform (IDCT) for decoding, which teaches post-processing "a sum and a difference between intermediate data." In other words, intermediate multiplication of the input occurs and it is the intermediate data that is subjected to additions and subtractions. See, *e.g.*, the description of Figure 11 of Uramoto and the accompanying description thereof on page 10, line 48 through page 12, line 22. Accordingly, Uramoto teaches away from the claimed invention. Thus, Uramoto does not teach or suggest decoding digital audio data by "preprocessing the input sequence of data elements to produce an array of sum data and an array of difference data ...; producing a first sequence of output values using the array of sum data; producing a second sequence of output values using the array of difference data; and forming decoded audio signals from the first and second sequences of output values" as recited. In fact, Uramoto teaches away from the claimed invention.

With regard to the decoding operation of Uramoto, the Examiner previously stated that Uramoto discloses a processing unit operable in a decoding application in which the processing unit is "in its same form as the processing unit disclosed in Fig. 5." More specifically, and in reference to Fig. 11, Uramoto states "[p]ostprocessing section 7 has the same configuration as that of Fig. 5 or 6" (page 12, line 24). Although Uramoto discloses a postprocessing section 7 (Fig. 11) that has the same configuration as preprocessing section 1 (Figs. 4 or 5), postprocessing section 7 does not "produce an array of sum data and an array of difference data using selected data elements from the input sequence," where the input sequence is an "input sequence of data elements representing encoded audio samples," as claimed.

In reference to the postprocessing section 7 of the IDCT processor (Fig. 11) having the same configuration as the preprocessing section 1 of the DCT processor (Fig. 4), Uramoto states "input circuit 21 sequentially or alternately receives intermediate terms Mi (i = 0 to 3), Ni (i = 0 to 3) to apply a desired combination of the terms to adder/subtractors 22, 23 (or

26)" (page 12, lines 24-26). That is, the postprocessing section 7 operates on intermediate terms to generate output data xi that is either a sum of intermediate terms (Mi and Ni) or a difference of intermediate terms, based upon the value of the integer i (page 12, lines 17-22). However, postprocessing section 7 does not operate on selected data elements from the input sequence to generate sum and difference data, where the selected data elements represent encoded audio samples. In other words, although postprocessing section 7 does operate as preprocessing section 1 to generate sum or difference data, postprocessing unit 7 does not generate an array of sum data and an array of difference data using selected data elements from the input sequence, as claimed.

Specifically, Uramoto discloses that $x2 = M2 + N2 = A \cdot y0 - C \cdot y2 - A \cdot y4 + B \cdot y6 + F \cdot y1 - D \cdot y3 + G \cdot y[5] + E \cdot y7$ (page 11, expression 13 and page 12, lines 7-20). That is, the sum output data generated by Uramoto (i.e.., x0, x1, x2, x3) is not comprised of "selected data elements form the input sequence," as claimed. Instead, Uramoto generates an output x2, for example, that comprises additions and subtractions of products of input data (y0, y1, y2, y3, y4, y5, y6, y7) and elements (A, B, C, D, E, F, G) of a coefficient matrix (expression 13, page 11).

The Examiner's position appears to be that Uramoto **could** be further modified to achieve the claimed invention. The mere fact that references could be further modified is insufficient to establish obviousness, and the Examiner cites no motivation for this proposed further modification other than alleged skill in the art. Moreover, if the combination were further modified as the Examiner appears to suggest, the combination would not operate in accordance with the principles of operation of the decoder of Uramoto, which teaches an IDCT for decoding. Thus, Uramoto cannot be considered to render the subject matter of claims 1-6, 11, 18 and 19 obvious.

Accordingly, Uramoto does not teach, suggest, or motivate, nor has the Examiner shown, decoding using "selected data elements from the input sequence" to generate either an array of sum data or an array of difference data, as claimed. Based at least upon the above arguments, Applicants respectfully submit that claims 1-6, 11, 18 and 19 are not obvious over Uramoto.

The Examiner rejected claims 7-10, 12-17 and 20 under 35 U.S.C. § 103(a) as obvious over Uramoto in view of ISO Standard 11172-3. Applicants respectfully traverse the Examiner's rejections. As an initial matter, ISO Standard 11172-3 does not remedy the deficiencies of Uramoto as discussed above in the conjunction with claims 1 and 11. ISO Standard 11172-3 does not teach, suggest or motivate "[a] method of **decoding** digital audio data, comprising the steps of ... preprocessing the input sequence of data elements to produce an array of sum data and an array of difference data **using selected data elements from the input sequence**," as recited in claim 1, or "[a] synthesis sub-band filter for use in **decoding** digital audio data, comprising ... pre-processing means for producing an array of sum data and an array of difference data **using selected data elements from the input sequence** ..." as recited in claim 11. Claim 8 similarly recites: "[a] method of decoding...input digital audio data samples ... comprising the steps of: ... producing an array of sum data ... [;] producing an array of difference data ... [;] producing a first output audio data sample by a multiply-accumulate operation." Claim 14 similarly recites, in part, "[an] MPEG decoder comprising ... means for producing an array of sum data and an array of difference data using selected data elements from the input sequence." Claim 7 depends from claim 1, claims 9, 10 and 20 depend from claim 8, claims 12 and 13 depend from claim 11, and claims 15, 16 and 17 depend from claim 14.

The Examiner again points to the description of Figure 5 of Uramoto, which describes an **encoder**. As discussed above, Uramoto teaches away from the claimed invention by describing the use of a difference method of decoding. See, e.g., the description of Figure 11 of Uramoto. Further, one would not be motivated to combine the inverse modified discrete cosine transform (IMDCT) with Uramoto, which as discussed above teaches the DCT for encoding and IDCT for decoding.

Further, with respect to claim 8, the sum output data $xi = MI + Ni$ for $I = 0, 1, 2, 3$ and the difference output data $xi = Mi - Ni$ for $i = 4, 5, 6, 7$ generated by postprocessing section 7 (Uramoto, page 12, lines 20-22 and Fig. 11) is not the same as the array of sum data $SADD[k] = S[k] + S[m-1-k]$ and the array of difference data $SSUB[k] = S[k] - S(m-1-k)$ (for $k = 0, 1$ ...(m/2-1)), as claimed. Uramoto discloses Mi to be an intermediate term comprised of additions and/or subtractions of products of input data (y0, y2, y4, y6) with coefficients A, B, C, and Ni to

be an intermediate term comprised of additions and/or subtractions of products of input data (y1, y3, y5, y7) with coefficients D, E, F and G (page 11, expression 13 to page 12, line 22). In contrast, S[k] and S[m −1 − k] are coded input digital audio data samples. In other words, it is clear that xi = Mi. Ni does not equal either SADD[k] or SSUB[k], since S[k] does not equal Mi and S[m-1-k] does not equal Ni.

Accordingly, Applicants respectfully submit that claims 1-20 are not rendered obvious by Uramoto, alone or in combination with ISO Standard 11172-3.

The Director is authorized to charge any additional fees due by way of this Amendment, or credit any overpayment, to our Deposit Account No. 19-1090.

All of the claims remaining in the application are now clearly allowable. Favorable consideration and a Notice of Allowance are earnestly solicited.

Respectfully submitted,

SEED Intellectual Property Law Group PLLC
